

NUMPY File Input Output

- **load()** and **save()** functions handle /numPy binary files (with **np**y extension)
- **loadtxt()** and **savetxt()** functions handle normal text files

NumPy introduces a simple file format for ndarray objects. This **.np**y file stores data, shape, dtype and other information required to reconstruct the ndarray in a disk file such that the array is correctly retrieved even if the file is on another machine with different architecture.

numpy.save()

The **numpy.save()** file stores the input array in a disk file with **np**y extension

```
import numpy as np
a = np.array([1,2,3,4,5])
np.save("file",a)
```

To reconstruct array from **f.npy**, use **load()** function.

```
import numpy as np
b = np.load('file.npy')
print (b )
```
